

This module project is made in collaboration with Thomas Goris.

URL: <http://hamun.internet-guiden.dk/animecons2/#/>

Build steps: (note: this build relies on node.js and npm, make sure these are installed!)

1. Open the project location in your command line
2. Type 'npm install' in the command line and press enter. You will install all of the dependencies.
3. Type 'npm run dev' in the command line and press enter. You will now run a localhost server.
4. There should be a localhost:8080 opened automatically now.

The following tools has been used for making a boilerplate:

<https://github.com/vuejs/vue-cli>

<https://github.com/vuejs-templates/webpack>

Dependencies:

- JQuery-editable-select (2.2.5): Used for the searchbar in the navigationbar
- Vue (2.4.2) : Used for making page templates
- Vue-router (2.7.0): Used to route between different pages
- Vue2-google-maps (0.8.3): Used to implement a map
- Bootstrap (3.3.7): Used to make the layout and certain functionalities (e.g. menu dropdown)
- Nodejs (6.11.3) for runtime building and local server hosting
- npm (5.4.2) importing vue and other libraries
- webpack (2.6.1) for bundling all of the files to make the pages lightweight.

The files we have made are the following:

- Navigation.js
- All css files in the css folder
- All of the .vue files inside the components folder
- index.js in the router folder
